Cara Therapeutics Initiates Pivotal Phase 3 Efficacy Trial of KORSUVA™ (CR845/difelikefalin) Injection in Hemodialysis Patients with Chronic Kidney Disease-Associated Pruritus

January 31, 2018

STAMFORD, Conn., Jan. 31, 2018 (GLOBE NEWSWIRE) -- Cara Therapeutics, Inc. (Nasdaq:CARA), a biopharmaceutical company focused on developing and commercializing new chemical entities designed to alleviate pruritus and pain by selectively targeting peripheral kappa opioid receptors, today announced the initiation of its first pivotal Phase 3 efficacy trial of KORSUVA™ (CR845/difelikefalin) injection in hemodialysis patients suffering from moderate-to-severe chronic kidney disease-associated pruritus (CKD-aP) in the United States (U.S.). The U.S. Food and Drug Administration (FDA) granted Breakthrough Therapy Designation to KORSUVA™ injection for this indication, for which there are currently no approved therapies in the U.S.

“The initiation of the first Phase 3 efficacy trial in dialysis patients with CKD-aP is a key milestone in the development of KORSUVA injection as a potential novel treatment option for a significant unmet medical need in this patient population,” said Derek Chalmers, Ph.D., D.Sc., President and Chief Executive Officer of Cara Therapeutics. "Additionally, through the rest of this year, we will be working to expand our clinical development activities with KORSUVA beyond hemodialysis patients into additional renal, hepatic and dermatological patient populations.”

KALM-1 Phase 3 Trial Design

The Phase 3 U.S. study is a multicenter, randomized, double-blind, placebo-controlled 12-week treatment trial (with a 52-week open label extension phase) in the U.S. designed to evaluate the safety and efficacy of 0.5 mcg/kg of KORSUVA injection in 350 hemodialysis patients with moderate-to-severe pruritus.

The primary efficacy endpoint is the proportion of patients achieving at least a 3-point improvement from baseline with respect to the weekly mean of the daily 24-hour worst itching intensity numeric rating scale (NRS) score at week 12. In a completed Phase 2 trial, the proportion of patients with an improvement from baseline in the weekly mean worst itching intensity NRS score of ≥3 points at week eight was statistically significantly higher in the KORSUVA 0.5 mcg/kg group compared to the placebo group (64% vs. 29%; p < 0.01)1.

Secondary endpoints of the Phase 3 trial include assessment of itch-related quality of life changes measured using validated self-assessment 5-D Itch and Skindex-10 scales, as well as the proportion of patients achieving > 4-point improvement from baseline in weekly mean of the daily 24-hour worst itching NRS score at week 12.

The FDA has conditionally accepted KORSUVA™ as the trade name for difelikefalin injection. CR845/difelikefalin is an investigational drug product and its safety and efficacy have not been fully evaluated by any regulatory authority.

About CKD-aP

CKD-aP is an intractable systemic itch condition that occurs with high frequency and intensity in patients with chronic kidney disease undergoing hemodialysis and peritoneal dialysis. Pruritus has also been reported in patients with stage III-V CKD who are not on dialysis. Aggregate, longitudinal, multi-country studies estimate the weighted prevalence of CKD-aP to be approximately 40 percent in patients with end-stage renal disease (ESRD), with approximately 25 percent of patients reporting severe pruritus. The majority of dialysis patients (approximately 60-70 percent) report pruritus, with 30 to 40 percent reporting moderate or severe pruritus. Recent data from the ITCH National Registry Study showed that among those with pruritus, approximately 59 percent experienced symptoms daily or nearly daily for more than a year. Given its association with CKD/ESRD, most afflicted patients will continue to have symptoms for months or years with currently employed antipruritic treatments, such as antihistamines and corticosteroids, unable to provide consistent adequate relief. Moderate-to-severe chronic pruritus has repeatedly been shown to directly decrease quality of life, contribute to symptoms that impair quality of life (such as poor sleep quality), and is associated with depression. CKD-aP is also an independent predictor of mortality among hemodialysis patients, mainly related to increased risk of inflammation and infections.

About Cara Therapeutics

Cara Therapeutics is a clinical-stage biopharmaceutical company focused on developing and commercializing new chemical entities designed to alleviate pruritus and pain by selectively targeting peripheral kappa opioid receptors (KORs). Cara is developing a novel and proprietary class of product candidates, led by CR845/difelikefalin, a first-in-class KOR agonist that targets the body’s peripheral nervous system. In Phase 2 trials, CR845/difelikefalin has demonstrated statistically significant reductions in itch intensity and concomitant improvement in quality of life measures in...
hemodialysis patients with moderate-to-severe CKD-associated pruritus. Additionally, CR845/difelikefalin has demonstrated initial signs of efficacy in patients with moderate-to-severe pain, without inducing many of the undesirable side effects typically associated with currently available opioid pain therapeutics.

**Forward-looking Statements**

Statements contained in this press release regarding matters that are not historical facts are "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Examples of these forward-looking statements include statements concerning the expected enrollment of the CR845/difelikefalin injection Phase 3 pivotal efficacy trial; the timing of data readouts for CR845/difelikefalin injection clinical trials; the ability of the clinical trials to demonstrate an extended patient benefit; the potential for CR845/difelikefalin to be a therapeutic option for CKD-aP or for pruritus associated with other hepatic or dermatological conditions; and the timing of initiating additional trials of CR845/difelikefalin. Because such statements are subject to risks and uncertainties, actual results may differ materially from those expressed or implied by such forward-looking statements. Risks are described more fully in Cara Therapeutics’ filings with the Securities and Exchange Commission, including the "Risk Factors" section of the Company’s Annual Report on Form 10-K for the year ended December 31, 2016 and its other documents subsequently filed with or furnished to the Securities and Exchange Commission. All forward-looking statements contained in this press release speak only as of the date on which they were made. Cara Therapeutics undertakes no obligation to update such statements to reflect events that occur or circumstances that exist after the date on which they were made.
